

THE EXPEDIENCY OF EVALUATION OF INITIAL LEVELS OF BRONCHIAL HYPERRESPONSIVENESS IN CHILDREN WITH BRONCHIAL ASTHMA

YU.G. ANTIPKIN, V.I. CHERNIVETS

Summary

There are the reasons to suggest that in children with asthma an increased bronchial hyperresponsiveness, caused by the disease exacerbation, can be brought to initial level. The data obtained confirm that an application of provocation test in so-called "training mode" diminished a sensitivity of bronchial receptors to this provoking agent.
