Summary

We studied efficacy of anti-viral medicine arbidol in combination with basis therapy in prophylaxis of infectious exacerbation of COPD. The results indicated that arbidol (0,2 g once per three days during 4 weeks), administered before and during flu season in combination with basis therapy, statistically significantly ($p < 0,05$) reduced the frequency of infectious exacerbations of COPD from $(3,2 \pm 0,2)$ to $(2,6 \pm 0,2)$.
