## *Summary*

We examined 32 patients with asthma (A) with concomitant gastroesophageal reflux disease (GERD). The patients were distributed into 2 groups. The patients from 1<sup>st</sup> group were on maintenance asthma therapy with additional proton pump inhibitors and antisecretory drugs on demand. The patients from 2<sup>nd</sup> group additionally took Berodual H twice daily. It was established that maintenance asthma therapy in combination with proton pump inhibitors in patients with A and concomitant GERD decreased clinical symptoms of both disorders, improved quality of life of patients and also improved pulmonary ventilation parameters. Addition of Berodual H to the standard therapy of patients with A and GERD led to significant reduction of attacks rate and improvement of bronchial permeability.
